tripeptidy1-peptidase (designated DPP) from Porphyromonas gingivalis. The prolyl tripeptidy1-peptidase has an amidolytic activity, and cleaves a peptide bond in a target polypeptide having at least 4 amino acids. This bond is between a proline and an amino acid attached to the alpha-carboxyl group end of the proline. The polypeptide is useful for identifying inhibitors. These inhibitors are then useful for reducing the growth of bacterium or for protecting an animal from a periodental disease such as gingivitis and periodontitis caused by
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          prolyl tripeptidyl-peptidase, active analog, fragment or variant useful
for identifying its inhibitor which is useful for protecting an animal
from a periodontal disease such as gingivitis and periodontitis

Tanaka T; Schlossman S, Morimoto C,

WPI; 1994-151317/18.

acid - useful for stimulating immune response, e.g. for treatment of AIDS to counteract immunosuppressive drug, and as vaccine Polypeptide fragments and analogues of CD26 and encoding nucleic

Claim 3; Page 49-52; 85pp; English.

The sequences given in AARS4612-14 represents analogues of the human T analogues pref. lack residues 3-9 or 24-34. These analogues are soluble under physiological conditions and lack enough amino acid residues to render them susceptible to cleavage by signal peptidase. Stimulating therapeutics, eg. they may be used for treatment of AIDS-related complex, other virally or environmentally-induced AIDS-related complex, other virally or environmentally-induced conditions, and certain congenital immune deficiencies. The peptides are be employed to increase immune function which has been impaired by use of immunosupressive drugs, such as certain chemotherapeutic drugs.

C26 cDNA library was constructed from human PHA-activated T cells using the CDM7vector.The hydrophobic N-terminal of the predicted CD26 polypeptide has the characteristics of a signal sequence of the type II membrane protein, which is
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Polypeptide fragments of CD26 - are capable of disrupting binding of CD45 and CD26 and thus interfering with T-cell activation
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           /label= active site of serine protease/esterase

reinforced by the observation that potential N-glycosylation sites are located in the carboxy side of the hydropholic core. Therefore the N-terminal 6 AAs are predicted to be cytoplasmic, the next 22 AAs are predicted to transverse the cytoplasmic membrane, and the 738 C-terminal AAs constitute the predicted extracellular domain.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       273 -----YDIEQGRLTCLTEMLDVHLADALIGDSLIGG-AEQRPIWTKDSQGFY-VIGTDQG

The invention is concerned with molypeptide fragments and analogues of CD26 which have internal deletions (see also AAR54612-14). The analogues pref. lack residues 3 st or 24.34. These analogues are analogues pref. lack residues 3 st or 24.34. These analogues are soluble under physiological conditions and lack enough amino acid residues to render them susceptible to cleavage by signal peptidase. The peptide fragments and analogues are useful as immune or response-simulating therapeutics, eg. they may be used for treatment of disease conditions characterised by immunosupression, eg. AIDS or AIDS-related complex, other virally or environmentally-induced complex, other virally or environmentally-induced complex in certain congenital immune deficiencies. The peptides can be employed to increase immune function which has been impaired by use of immunosupressive drugs, such as certain chemotherapeutic drugs.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ----YDIEQGRLTCLTEMLDVHLADALIGDSLIGG-AEQRPIWTKDSQGFY-VIGTDQG 325

Byun T, Klotz A, Rey MW; Brown K, Blinkovsky A,

New dipeptidyl aminopeptidase from Aspergillus oryzae - used to produce protein hydrolysates enriched in particular amino acids, useful as flavour enhancers, e.g. in doughs WPI; 1999-045232/04.

Example 7; Page 59-61; 77pp; English.

The present sequence represents dipeptidyl aminopeptidase (DPAP) from Saccharomyces cerevisiae. DPAP acts synergistically with aminopeptidase (AP) to hydrolyse polypeptides, producing protein hydrolysate (PH), useful in foods as flavour enhancer, e.g. in baked goods, enriched in:

30; (a) Ala, Arg, Asp, Gly and/or Val, or (b), if the substrate has been deamidated, in Glu (free and/or peptide bound), in which case products are useful as animal feed additives. DAPP can also be used in flavouralso for deactivating enzymes and for converting precursors to mature proteins. DPAP increases the level of hydrolysis of proteins and thus proteins and thus that are resistant to either enzyme used alone. PH have improved solubility, emulsifying and foaming properties, and products containing them have better flavour, palatability, mouthfeel, aroma and crust 220 detfevnlggnrflyegveftvstvqinykldklifgtnlesefrhsskgfywikdlntg 279 55 GSVPWTHGEKRSTD------PRWSPDGRTLAFISDREGDAAQLYIMSTEGGEARKL 104 335 te---dgskdifnakpdwiyeeevlasdgaiwwapddsk--avfarfndtsvddirlnry 389 280 niepilppeksddnyelglsklsyahfspaynyiyfvyen----nlflqqvnsgvakkv 334 ----WSPDGESILVTISLGEGESIDDREKTEQ 143 144 DSYEPVEVQGLSYKRDGKGLTRGAYAQLVLVSVKSGEMKEL-TSHKADHGDPAFSPDGKW 202 445 ispdtfrfei--tdrnskildvkvydipssqmltvrntnsnlfngwiektkdilsippkp 502 --DLKQVTP-- 236 237 --HRGSFGSSSFSPDGRYLALL-------GNEKEYKNATLSKAWLYDIEQG 278 Gaps 503 elkrmdygyidihadsrgfshlfyyptvfakepiqltkgnwevtgngivg----yeyetd 558 279 RLTCLTEMLDV---HLADALIGDSLIGGAEQRPIWTKDSQGFYVIGTDQGSTGIYYISIE 335 336 GLVYPIRLEKEYINSFSLSPDEQHFIASVTKPDRP------SELYSIPLGQEE 382 602 -----dfelsssaryaisklgpdtpikvagpltrvlnvaeihddsilglt 647 648 k-----dekfkekiknydlpitsyktmvlddgveinyieikpanlnpkkkypilvniygg 702 9 DITAIVSVTDPQYAPDGTRAAYVKSQVNQEKDS--YTSNI-------WIYETKTG 54 559 tifftaneigvmsqhlysisltdsttqntfgslqnpsdkydfy-------- 601 383 KQLTGANDKF---VREHTISIPEEIQYATEDGVWVNGWLMRPAQMEGETTYPLILNIHGG 439 440 PHMMYGHTYF-----HEFQVLAAKGYAVVIINPRGSHGYGQEFVNAVRGDYGGKDYDD 492 493 VMQAVDEAIKRD-PHIDPKRLGVTGGSYGGFMTNWIVGQTN--RFKAAVTQRSISNWISF 549 550 HGV-----SDIGYFFTDWQLEHDMFEDTEKLWDRSPLKYAANVETPLLILHGER 598 819 dsvyterymngpsenhegyfevstignfksfeslkrlf-----ivhgtf 862 759 itevtkkfigrnsghideskiaiwgwsyggftslktveldngdtfkyamavapvtnwtly Best Local Similarity 20.18; Pred.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The present sequence represents a prolyl tripeptidyl-peptidases from Porphyromonas gingivalis, which is designated PTP-A. The prolyl tripeptidyl-peptidase has an amidolytic activity, and cleaves a peptide bond in a target polypeptide having at least 4 amino acids. This bond is between a proline and amino acid attached to the alpha-carboxyl group end of the proline. The polypeptide is useful for identifying inhibitors. These inhibitors are then useful for reducing the growth of bacterium or for protecting an animal from a periodontal disease such as gingivitis and periodontitis caused by

acylaminoacyl-peptidase (EC 3.4.19.1) - rat
N.Alternate names: acyl-peptide hydrolase; acylamino-acid-releasing enzyme
C.Species: Rattus norvegicus (Norway rat)
C.Date: 30-Jun-1993 #sequence\_revision 30-Jun-1993 #text\_change 18-Jun-1999
C.Accession: A33706; S07624
E.Kobayashi, K.: Lin, L.W.: Yeadon, J.E.; Klickstein, L.B.: Smith, J.A.
J. Biol. Chem. 264, 8892-8899, 1989
A.Title: Cloning and sequence analysis of a rat liver cDNA encoding acyl-peptide hydr A.Reference number: A33706; MUID:89255359

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 FUNCTION: THIS ENZYME CATALYZES THE HYDROLYSIS OF THE AMINO-
FERMINAL PEPTIDE BOND OF AN N-ACETYLATED PEPTIDE TO GENERATE
AN N-ACETYLATED AA AND A PEPTIDE WITH A FREE AMINO-TERMINGS.
IT PREFERENTIALLY CLEAVES OFF AC-ALA, AC-MET AND AC-SER.
CATALYTIC ACTIVITY: ACYLAMINOACYL-PEPTIDE + H(2)O = ACYLAMINO
                                                                                                                                                                                                                                                                                                                                                                                                    Eukaryota, Metazoa, Chordata, Craniata, Vertebrata, Euteleostomi,
